

Supporting-baseline detection metrics

Fixed five-fold OOF estimates with 10,000 class-stratified bootstrap replicates; the horizontal scale is intentionally zoomed.

● Logistic Regression ■ Random Forest

Metric value with 95% bootstrap interval (zoomed scale: 0.88-1.01)
The zoomed scale is used only to distinguish near-ceiling estimates; all metrics retain their original 0-1 definitions.

Random Forest intervals collapse at 1.0 because the fixed OOF record contains no observed errors; this is not an external-performance guarantee.
